

## Sharepoint Installation Questions

I have an HP DV7-1175nr with Vista Home Premium and an MSDN subscription. My Vista disk labeled July 2008 Vista with SP1 will not upgrade this to Ultimate.

-  
1. Running the upgrade while entering the key and selecting the option to update the install process returns an error "An error has occurred Windows installation will have to restart"

2. Running the upgrade bypassing the authentication simply disables the upgrade option.

There is plenty of disk space (200GB) and I am selecting the correct 64 bit version of Ultimate.

-  
Please help. I need to upgrade so I can use Virtual PC 2007 for a Sharepoint Development Server.

Answer :: This thread was a very similar situation, but was unsuccessful as well.

<http://www.vistaheads.com/forums/microsoft-public-windows-vista-installation-setup/283603-upgrade-vista-x64-oem-home-ultimate-msdn-subscription-2.html>

rel="nofollow"><http://www.vistaheads.com/forums/microso...></a>

I don't see why it should be a problem unless the original OS were 32-bit, but your model # pulls up w/ specs including 64-bit Vista. Perhaps the MSDN disc requires a clean install, although you'd think the option wouldn't be available if that were the case.

However, Virtual PC 2007 will work with Home Premium, even if it's not listed as a "supported" OS on their site may give a warning (I had Vista Home Premium x64 w/ SP1 running VPC2007 fine). Make sure you have VPC 2007 SP1:

Hi, I have Sharepoint Portal 2003 Server installed on one server, about 1 GB DB. I want to test uninstalling it (I have it replicated on a test box), of course creating a backup with the backup data utility and then reinstalling and restoring it. I uninstalled it completely, reinstalled it and went into the backup/restore utility however I am at a standstill because I get all these errors like there is no portal site found to restore it to. Is what I'm doing possible, and if so what are the right steps (having the backup SP files of course) in restoring a portal site completely from a fresh install of the SP Portal 2003 server program on that replicated {Replicated name/static ip and everything} machine?

Answer :: You can try to take it at a professional store, i mean take it to a pro, so you can make sure you get what you want .... [Read More](#)

I have Windows XP Media Center. I have automatic updates turned on for Windows XP, and I'm getting the notice that updates are available. I choose to install them, but then they all fail.

-  
These are the updates that are failing installation.

-  
[Security Update for Microsoft Publisher 2002 \(KB950129\)](#)

[Security Update for Microsoft Office XP \(KB947866\)](#)

[Security Update for Office XP \(KB920816\)](#)

[Security Update for SharePoint Team Services \(KB911701\)](#)

[Security Update for Office XP \(KB944423\)](#)

[Security Update for Microsoft Word 2002 \(KB954463\)](#)

- [Any help is appreciated, thank you.](#)

Answer :: Check this page for help.

One comment, it looks like you have the small business edition of Office XP on your computer. Try downloading the stand alone version of the updates from the Microsoft download center, often that version will install when the version on Microsoft Update fails. .... [Read More](#)

[If no, is there any workaround w/o sharepoint? I'm facing a situation that in my department, there is only one or 2 people need to generate the form, it makes sense to have InfoPath installed on their machines. However, those who don't need to generate the forms, just need to fill out the forms, i don't want to install InfoPath on their machines \(just to save some money\). I'm trying to see if users without InfoPath installed on their machines can fill out the infopath-generated forms \(electronically and no sharepoint involved\)](#)

Answer :: You can if you have Infopath Forms Services installed. Once you have that, your users can use their browser to fill out Infopath forms. .... [Read More](#)

[i recently downloaded a vista upgrade but when i try and upgrade from XP media center to Vista Home Premium, it checks compatibility and then comes up with:](#)

- [Close Windows installation, go to Programs, and uninstall the following programs:](#)

- [o Windows SharePoint Services](#)

- [I don't have windows sharepoint services and cannot find any trace of it on my computer.](#)

[I don't particularly want to do a clean install as i will have to backup all of my files.](#)

- [Anyone know what to do?](#)

Answer :: Vista sucks .... [Read More](#)

[I have this problem with the default profile in microsoft windows xp. When I configure the system and copy the configured profile, let's call it temp1, back to the default profile the following happens.](#)

- [1. When I log into windows under any other username/profile than temp1 when trying to make changes in excel and word the username of the modified is always temp1. This is also when editing documents from sharepoint team services web pages.](#)

[2. I run office as the temp1 user to configure office so I can copy it back to the default profile so office does not need to install for every user.](#)

3. When I decided not to configure the temp1 profile and copy it back to default profile, i ran office as an administrator and was able to use word, outlook, and excel. When I logged back in as any other user the computer asks to have the source media for office. I have already installed Microsoft Office 2003 Enterprise with all the service packs and updates installed.

-  
Any ideas to make work?

Answer :: You need to open the NTUSER.DAT file in regedit. Go through it and take out user specific entries. Maybe search it for "temp1" or find out the sid of temp1 and search for that string.

Install office from a shared network location, preferably a hidden share that users have read access to. .... [Read More](#)

The full error is:

Failed to register SharePoint services. An exception of type System.Data.SqlClient.SqlException was thrown. Additional exception information: DDL statement is not allowed.

-  
I know this has something to do with SQL 2005, but I don't know much about SQL. I started with a clean install. Anyone know????? Please?? Oh, also, I am working on Windows Server 2003 Standard Edition. We also have one more program running with SQL capabilities, Protection Pilot. I don't know if that makes a difference.

Answer :: Hi

its not an error

had you applied any latest service pack or server os patches

apply the latest service pack uninstall sharepoint if u installed previously

then reset iis

then restart server and again install then it wont come

i do not have windows sharepoint services on my laptop, but vista seems to not install because of that program? what to do????

Answer :: start over and do a clean installation, XP and Vista dont play well together. even if microsoft tells you it will work, i have never seen it happin right .... [Read More](#)

Can I install sharepoint 2003 on windows xp pro, Purpose that I want to install on win xp pro are to try it before I do it on my win 2003 server.

Answer :: You could install a virtual machine, so that you don't mess up your current portal.

You can try N buy here:

<http://office.microsoft.com/en-us/sharepointserver/HA102488011033.aspx>

And you can download a trial here:

<http://www.microsoft.com/downloads/details.aspx?FamilyId=2E6E5A9C-EBF6-4F7F-8467-F4DE6BD6B831&displaylang=en>

Oh, wait, that is for MOSS2007, but the virtual machine should work if you already have a copy of SP 2003. ....

[I am trying to install SharePoint but it says that I have to have Windows Server as a OS in my computer... is there any way I can install SharePoint on XP?](#)

[Tks](#)

Answer :: no we cannot install sharepoint in xp  
why because sharepoint is server component  
it requires active directory services  
,mailservices  
we must and should present win server 2003 sp 2or 1

.... [Read More](#)

[Ok, so we have a server with Sharepoint Portal Server 2003 installed. We want to take all the sites and everything and archive them \(preferably on a removable medium\). Then we want to clear everything and install Sharepoint Server 2007. So my question is, what's the easiest way to export the sites from Sharepoint Portal Server 2003? Preferably export as an image onto a removable medium.](#)

Answer :: There is no 'easy' way to do this.

If you have any customization at all on the 2003 sites, then all those document libraries and lists will have to be imported into 2007 manually.

If you have standard lists and documents, you can:

Use explorer view to export documents from each 2003 library to a local machine, (or, if you have keyboard access to the 2007 server, you can download them there). Create a new 2007 doc lib for each doc lib in 2003, and upload them using the 'upload multiple' option in your new 2007 doc lib.

Lists are a bit easier, but not much: Use the 'Export to Spreadsheet' function for each of your lists. If you have them in Excel, you can right-click the list in Excel, and un-link the list by choosing List --> Unlink List. Now, using Excel, you can export your datasheet as a new SharePoint list. In Office 12, select the data, convert to a table, then using the design tab, select Export --> Export Table to SharePoint List.

Users and groups also need to be imported, and everything else.

You have a big project on your hands. .... [Read More](#)

[Hi. I installed maximizer software and then tried to install sharepoint portal but the SQL database doesn't like it \(I can't remember the error code but it was something like SQL client exception\). I went on google and there doesn't seem to be any solutions. I'm really stuck. Any ideas?](#)
